To Whom It May Concern,

I am writing to recommend Dorsa Dolatkahh Ouchbolagh, who completed a summer internship with us at Rierco in our mechanical and physical testing laboratory. While my own role is on the management side of the company, I've had the chance to follow her progress closely through regular updates from our lab supervisors and operators, and I'm glad to put that feedback into writing.

During her time in the lab, Dorsa handled Mooney viscosity measurements, MDR testing and tensile testing on rubber compounds as part of her regular responsibilities. She also got hands-on experience compounding elastomeric materials on a two-roll mill, curing them by hot press, and cutting and testing dog-bone samples for tensile strength. One thing the team specifically mentioned was her involvement in a project looking at how different curing agents affect the final properties of rubber compounds — she took real ownership of that work rather than just running tests on request.

Beyond that, she was trained on and worked with FTIR, gas chromatography, resilience testing, rheometry and Shore hardness testing, so she came away with a fairly broad hands-on foundation across the equipment we use day to day, not just one narrow task.

What came up repeatedly in feedback from her supervisors was her reliability: she was punctual, careful with procedure, and didn't need much hand-holding once she understood a task. For an intern, that level of independence in a lab setting isn't that common, and it's part of why I'm comfortable recommending her.

Based on her performance here and what she picked up in a relatively short time, I think she'd do well in a master's program in Polymer Engineering, and I'd support her application.

Sincerely,

Management

A. Babaei
